A;Title: CDN sequencing and expression of rat mast cell tryptase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A. Molecule type: mRNA
A. Residues: 1-274 <IDE>
A. Cross references: DBJ:D38455; NID:9556555; PIDN:BAA07486.1; PID:9556556
C. Comment: This enzyme is basically specific for a connective tissue mast cell, it is usednase inhibitors.
C. Superfamily: trypsin; trypsin homology
C. Superfamily: trypsin; trypsin; basically serine proteinase; zymogen

C; Comment: This protein, synthesized in the liver, circulates as a noncovalent complex very expanse is activated by factor XIIa, which cleaves the molecule into a liar elinked by one or more disulfide bonds.
C; Comment: The enzyme cleaves Lys-Arg and Arg-Ser bonds. It activates, in a reciprocal ringen and may also play a role in the renin-angiotensin system by converting prorenin in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A; Molecule type: mRNA

-!- FUNCTION: TRYPPASE IS THE MAJOR NEUTRAL PROTEASE PRESENT IN MAST CELLS AND IS SECRETED UPON THE COUPLED ACTIVATION-DEGRANULATION RESPONSE OF THIS CELL TYPE.
-!- CATALYTIC ACTIVITY: PREFERENTIAL CLEAVAGE: ARG-|-, LYS-|-, BUT WITH MORE RESTRICTED SPECIFICITY THAN TRYPSIN.
-!- SUBBUNIT: HOWOTETRAMER.
-!- SUBCELLULAR LOCATION: RELEASED FROM THE SECRETORY GRANULES UPON
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vandersice P., Craik C.S., Nadel J.A., Caughey G.H.; Molecular cloning of dog mast cell tryptase and a related protease: structural evidence of a unique mode of serine protease activation.";

BLOL. Chem. 262:1363-1373(1987).

-1- FUNCTION: TRYPTASE IS THE MAJOR NEUTRAL PROTEASE PRESENT IN MAST CELLS AND IS SECRETED UPON THE COUPLED ACTIVATION-DEGRANULATION RESPONSE OF THIS CELL TYPE.

-1- CATALYTIC ACTIVITY: PREFERENTIAL CLEAVAGE: ARG-|-, LYS-|-, BUT WITH MORE RESTRICTED SPECIFICITY THAN TRYPSIN.

-1- SUBUNIT: HOMOTETRAMER.
                                                                                                                                                                                                                                                                                                                                                                       "Human pituitary tryptase: molecular forms, NH2-terminal sequence, immunocytochemical localization, and specificity with prohormone and fluorogenic substrates.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SUBCELLULAR LOCATION: RELEASED FROM THE SECRETORY GRANULES UPON MAST CELL ACTIVATION.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE TRYPSIN FAMILY. STRONGEST TO OTHER TRYPTASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CHARGE RELAY SYSTEM (BY SIMILARITY).

DEVELOPMENTAL STAGE: IS NOT EXPRESSED IN MATURE SEROSAL OR
MUCOSAL MAST CELLS AND IS EXPRESSED ONLY TRANSIENTLY AT AN EARLY
STAGE OF IN VITRO MAST CELL DIFFERENTIATION.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE
TYPPSIN FAMILY. STRONGEST TO OTHER GRANZYMES AND TO MAST CELL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Signal; Zymogen; Alternative splicing;

C. -!- FUNCTION: THE ENZYME CLEAVES LYS-ARG AND ARG-SER BONDS. IT
ACTIVATES, IN A RECIPROCAL REACTION, FACTOR XII AFTER ITS BINDING
C. -!- FUNCTION: THE ENZYME SURFACE. IT ALSO RELEASES BRADYKININ FROM
HWW KININOGEN AND MAY ALSO PLAY A ROLE IN THE RENIN-ANGIOTENSIN
C. SYSTEM BY CONVERTING PRORENIN INTO RENIN.
C. SUBUNIT: THE ZYMOGEN IS ACTIVATED BY FACTOR XIIA, WHICH CLEAVES
C. THE MOLECULE INTO A LIGHT CHAIN, WHICH CONTAINS THE ACTIVE SITE,
AND A HEAVY CHAIN, WHICH ASSOCIATES WITH HWW KININOGEN. THESE
CHAINS ARE LINKED BY ONE OR MORE DISULFIDE BONDS.

SYSTEM BY CONVERTING PRORENIN INTO RENIN.

-!- SUBUNIT: THE ZYMOGEN IS ACTIVATED BY FACTOR XIIA, WHICH CLEAVES THE MOLECULE INTO A LIGHT CHAIN, WHICH CONTAINS THE ACTIVE SITE, AND A HEAVY CHAIN, WHICH ASSOCIATES WITH HWW KININGEN. THESE CHAINS ARE LINKED BY ONE OR WORE DISULFIDE BONDS.
-!- DISEASE: DEFECTS IN KLK3 ARE THE CAUSE OF FLETCHER FACTOR DEFICIENCY, A BLOOD COAGULATION DEFECT.
-!- SIMILARITY: CONTAINS 4 APPLE DOMAINS.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI; ALSO KNOWN AS THE TRYPSIN FAMILY. PLASMA KALLIKREIN SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PLASMA KALLIKREIN HEAVY CHAIN.

The CDNA Structure of rat plasma kallikrein.";

L. FUNCTION: THE ENZYME CLEAVES LYS-ARG AND ARG-SER BONDS. IT

ACTIVATES, IN A RECIPROCAL REACTION, FACTOR XII AFTER ITS BINDING

C. AN DEGATIVELY CHARGED SURFACE. IT ALSO RELEASES BRADYKININ FROM HAW KINTNOGEN AND MAX ALSO PLAY A ROLE IN THE RENIN - ANGIOTERNIN CONTAINS THE ACTIVE SITE,

C. I- SUBUNIT: THE ZYMOGEN IS ACTIVATED BY FACTOR XIIA, WHICH COLEAVES

THE MOLECULE INTO A LIGHT CHAIN, WHICH CONTAINS THE ACTIVE SITE,

AND A HEAVY CHAIN, WHICH ASSOCIATES WITH HAW KININGEN. THESE

C. I- SIMILARITY: CONTAINS 4 APPLE DOMAINS.

C. I- SIMILARITY: CONTAINS THE PROPERTY.

C. I- SIMILARITY: SOUND ON THE STRUCK SITE,

C. I- SUMMINITY SITE,

C. I- SUMMINITY SITE,
